Control strategies for UAV and VTOL systems

State-of-the-Art Review of Control Strategies and Algorithms for UAV and VTOL Systems (2020–2022)

Quick Reference

Key Findings Table

Control Paradigm	2020 Key Articles	2021 Key Articles	2022 Key Articles	Main Contributions
Nonlinear	1 2 3 4 5	6 7 8 9 10	11 12 13 14 15	Feedback linearization, backstepping, hybrid neural network integration, unified control for transitions
Adaptive	1 4 16 17 18	2 19 20 21 22	23 24 25 26 27	Adaptive PID/LQG/MRAC, fuzzy/neuro-fuzzy, hybrid MRAC-Kalman, disturbance rejection
Robust	1 28 29 30 31	3 4 17 32 33	29 34 35 36 37	H-infinity, L1 adaptive, sliding mode, disturbance observer-based, fault-tolerant control
MPC	38 39 40 41	4 42 43 44 45	46 47 48 49 50	Real-time nonlinear MPC, DRL-MPC integration, unified control, cognitive control trends

Direct Answer

This review synthesizes state-of-the-art contributions on control strategies for UAV and VTOL systems from 2020 to 2022, emphasizing nonlinear, adaptive, robust, and model predictive control techniques. For each year, studies published in Elsevier journals have introduced innovations such as LQG controllers integrated with AI methods [1] [2], additive state decomposition and backstepping methods for transition stability [6] [13], and hybrid MRAC setups combined with Kalman filtering for improved state estimation [20] [51]. Furthermore, robust control approaches integrating disturbance observers and sliding mode control [29] [31], as well as recent advancements in real-time nonlinear MPC with machine learning enhancements [38] [49], demonstrate a clear trajectory toward unified and computationally efficient control architectures designed to meet the challenges of dynamic operating environments and multi-phase flight regimes.

Study Scope

- **Time Period:** 2020–2022
- **Disciplines:** Control engineering, robotics, aerospace engineering
- **Methods:** Systematic review of Elsevier (ScienceDirect) articles; focus on nonlinear, adaptive, robust, and model predictive control (MPC) for UAV and VTOL systems

Assumptions & Limitations

- Only Elsevier (ScienceDirect) articles from 2020–2022 are included.
- The review emphasizes four main control paradigms; other methods (e.g., classical PID, LQR) are referenced only when hybridized with advanced techniques.
- Real-world implementation and hardware-in-the-loop validation are less frequently reported than simulation-based studies.
- Some research gaps remain in unified control, real-time implementation, and computational efficiency.

Suggested Further Research

- Development of hybrid computational architectures combining reduced-order MPC with online deep reinforcement learning for real-time adaptation.
- Seamless integration of adaptive, robust, and data-driven methods for all flight phases, especially during transitions.
- Real-time hardware implementation and validation of advanced nonlinear MPC and DRL-integrated control schemes.

1. Introduction

The rapid evolution of unmanned aerial vehicles (UAVs) and vertical take-off and landing (VTOL) systems has catalyzed the demand for advanced control strategies capable of handling complex, nonlinear, and uncertain dynamics. Modern aerial vehicles, especially hybrid and convertible VTOL platforms, operate across diverse flight regimes, requiring controllers that ensure stability, robustness, and adaptability during aggressive maneuvers and mode transitions. This review focuses on the state-of-the-art in nonlinear, adaptive, robust, and model predictive control (MPC) methods, drawing exclusively from Elsevier (ScienceDirect) publications between 2020 and 2022. The selection of this period captures the latest trends, including the integration of data-driven and classical control approaches, and the emergence of unified frameworks for multi-mode flight [1] [16] [28] [38].

Scope and Motivation

This review targets UAV and VTOL platforms, emphasizing four advanced control paradigms: nonlinear, adaptive, robust, and MPC. The years 2020–2022 were chosen to capture the most recent innovations, and Elsevier journals were selected for their high impact and comprehensive coverage of control engineering research. The motivation is to provide researchers and practitioners with a concise synthesis of key advancements, comparative insights, and future research directions in this rapidly evolving field [1] [16] [28] [38].

2. Theoretical Frameworks

Nonlinear Control Methods for UAV and VTOL Systems

Nonlinear control strategies are essential for managing the inherent nonlinearities and coupling effects in UAV and VTOL dynamics, especially during transitions between flight modes. Key theoretical approaches include feedback

linearization, backstepping, sliding mode control, and hybrid data-driven methods [3] [5] [6] [7] [13].

- **Feedback Linearization:** Transforms nonlinear system dynamics into an equivalent linear system, enabling the application of linear control techniques while preserving stability [3].
- **Backstepping:** A recursive design method that constructs Lyapunov functions for each subsystem, ensuring global stability and robustness to uncertainties [5].
- **Sliding Mode Control (SMC):** Provides robustness against matched uncertainties and disturbances by enforcing system trajectories to "slide" along a predefined manifold [52] [53].
- **Hybrid Data-Driven Approaches:** Integrate neural networks, reinforcement learning, and machine learning with classical nonlinear controllers to enhance adaptability and robustness [54] [55] [56].

Adaptive Control Techniques

Adaptive control algorithms dynamically adjust controller parameters in response to system uncertainties, sensor noise, and environmental disturbances. Prominent methods include adaptive PID, LQG, MRAC, fuzzy/neuro-fuzzy controllers, and hybrid schemes [1] [16] [20].

- **Adaptive PID/LQG:** Adjusts gains based on real-time measurements, improving performance under varying flight conditions [1] [16].
- **Model Reference Adaptive Control (MRAC):** Forces the system to follow a reference model, with adaptation laws compensating for uncertainties [20].
- **Fuzzy/Neuro-Fuzzy Controllers:** Employ rule-based or neural network-enhanced inference systems for real-time adaptation to nonlinearities [2] [18].
- **Hybrid MRAC-Kalman Filtering:** Combines adaptive control with state estimation for improved robustness and noise rejection [20].

Robust Control Approaches

Robust control methods are designed to maintain stability and performance in the presence of model uncertainties, actuator faults, and external disturbances. Key frameworks include H-infinity, L1 adaptive, disturbance observer-based, and sliding mode control [28] [29] [31] [35].

- **H-infinity Control:** Minimizes the worst-case gain from disturbance to output, ensuring robust performance [17] [28].
- **L1 Adaptive Control:** Provides fast adaptation and robustness to uncertainties, particularly in tilt-wing VTOL UAVs [30] [32].
- **Disturbance Observer-Based Backstepping:** Estimates and compensates for disturbances, enhancing trajectory tracking and robustness [31] [37].

- **Fault-Tolerant Control:** Integrates robust and adaptive methods to handle actuator/sensor faults and maintain safe operation [35] [57].

Model Predictive Control (MPC)

MPC optimizes control actions over a finite horizon, handling constraints and multi-variable interactions. Recent trends include nonlinear MPC, integration with machine learning, and unified control for hybrid UAVs [38] [45] [49].

- **Nonlinear MPC (NMPC):** Handles complex, nonlinear dynamics and constraints, suitable for full-envelope trajectory tracking [38] [41].
- **Learning-Enhanced MPC:** Incorporates machine learning or deep reinforcement learning for model adaptation and improved autonomy [45] [49].
- **Unified MPC Frameworks:** Enable seamless control across all flight modes without switching controllers [41] [43].

3. Methods & Data Transparency

This review systematically aggregates findings from at least five Elsevier (ScienceDirect) articles per year (2020–2022) for each control paradigm. Article selection was based on relevance, citation impact, and coverage of UAV/VTOL platforms. Key contributions and innovations were extracted, and comparative analysis was performed across paradigms and years. All claims are supported by direct citations to the underlying studies.

4. Critical Analysis of Findings

Nonlinear Control Methods

Recent Advancements

- **LQG and AI Integration:** LQG controllers have demonstrated superior performance over PID in VTOL position control, except under heavy loading, while deep learning methods have improved control accuracy and safety tracking in unmanned helicopters [1] [2].
- **Feedback Linearization and Backstepping:** These methods have enabled local asymptotic stability and robust trajectory tracking, especially during transition phases in VTOL UAVs [3] [5] [6] [7].
- **Unified Nonlinear Control:** Unified geometric control laws and nonlinear model predictive controllers have been developed to operate seamlessly across all flight modes, reducing the need for controller switching and improving transition performance [15] [58].

Data-Driven and Hybrid Approaches

- **Neural Networks and RL:** Data-driven models, including neural networks and reinforcement learning, have been integrated with classical controllers to enhance adaptability and robustness, particularly in handling nonlinearities and uncertainties [54] [55] [56].

- **Hybrid Control:** Hybrid frameworks combining classical and data-driven methods are increasingly used to achieve unified control across flight modes, reducing complexity and computational demands [4].

Synthesis

Nonlinear control methods have evolved from classical feedback linearization and backstepping to hybrid and unified frameworks that leverage data-driven techniques for improved adaptability and robustness. Unified controllers for multi-mode flight and machine learning integration are prominent trends [4] [56].

Adaptive Control Techniques

Innovations and Effectiveness

- **Adaptive PID/LQG/MRAC:** Adaptive controllers with variable gains and model reference adaptation have improved stability, disturbance rejection, and tracking performance in UAVs and VTOLs [1] [16] [20].
- **Fuzzy/Neuro-Fuzzy Systems:** These controllers handle uncertainties and adapt in real-time, outperforming static fuzzy and classical PID controllers [2] [18].
- **Hybrid MRAC-Kalman Filtering:** Combining MRAC with Kalman filtering enhances state estimation and robustness to sensor noise and disturbances [20] [59].

Disturbance and Noise Rejection

- **Fuzzy-LADRC and ASM-ADRC:** These adaptive schemes effectively mitigate sensor noise, actuator faults, and environmental disturbances, outperforming traditional LADRC and PID controllers [22] [24].
- **ANFIS and Disturbance Observers:** ANFIS controllers and disturbance observer-based methods provide robust performance under noise and wind disturbances [25] [26].

Synthesis

Adaptive control research emphasizes hybridization with robust and estimation techniques, leading to significant improvements in disturbance rejection, noise robustness, and state estimation. The integration of MRAC with Kalman filtering and sliding mode control is particularly effective [20] [59].

Robust Control Approaches

Robustness and Fault Tolerance

- **H-infinity and L1 Adaptive:** These controllers ensure robust stability and performance under aerodynamic disturbances and uncertainties, validated in tilt-rotor and tilt-wing VTOL UAVs [17] [28] [30].
- **Disturbance Observer-Based Backstepping:** Enhances trajectory tracking and robustness during multi-phase flight, outperforming PID and INDI controllers in tail-sitter UAVs [31] [37].

- **Fault-Tolerant Control:** Sliding mode, adaptive observers, and hierarchical control algorithms effectively handle actuator faults, ground effect, and external disturbances [35] [57] [60].

Synthesis

Robust control methods have advanced toward integrated frameworks that combine disturbance estimation, adaptive mechanisms, and fault-tolerant strategies. These approaches are validated in both simulation and hardware-in-the-loop experiments, demonstrating reliable performance in adverse conditions [29] [31].

Model Predictive Control (MPC)

Real-Time Implementation and Trends

- **Nonlinear and Unified MPC:** NMPC frameworks with quadratic programming solvers have been implemented for eVTOLs, achieving real-time trajectory tracking and unified control across flight modes [38] [41].
- **Learning-Enhanced MPC:** Integration of deep reinforcement learning with MPC has led to hybrid algorithms that improve constraint satisfaction, reduce sample complexity, and enhance adaptability [45] [49].
- **Cognitive and Autonomous Control:** Emerging trends include cognitive control systems and learning-based MPC for enhanced autonomy and adaptability in uncertain environments [4] [38] [61].

Research Gaps

- **Real-Time Hardware Implementation:** There is a notable gap in deploying advanced nonlinear MPC and DRL-integrated controllers on resource-constrained hardware [4] [38].
- **Unified Control Schemes:** Further work is needed to develop seamless, unified control frameworks that operate across all flight phases without switching [4].

Synthesis

MPC research is rapidly evolving toward real-time, learning-enhanced, and unified frameworks. The integration of deep reinforcement learning and machine learning is a key trend, though challenges remain in computational efficiency and real-world deployment [4] [49].

5. Real-world Implications

- **Enhanced Autonomy:** Integration of AI and learning-based methods with classical control frameworks is enabling higher levels of autonomy, adaptability, and robustness in UAV and VTOL systems [56] [62].
- **Unified Multi-Mode Flight:** Unified control approaches reduce the need for controller switching, improving safety and performance during transitions in hybrid and convertible VTOL platforms [15] [41].
- **Fault Tolerance and Safety:** Robust and adaptive control strategies are critical for ensuring safe operation under actuator faults, sensor noise, and environmental disturbances, supporting applications in urban air mobility

and autonomous logistics [23] [35].

- **Real-Time Implementation:** Advances in real-time MPC and hybrid adaptive controllers are paving the way for deployment on embedded hardware, though computational challenges persist [19] [38].

6. Future Research Directions

- **Hybrid Computational Architectures:** Develop architectures that combine reduced-order MPC with online deep reinforcement learning for real-time adaptation without overwhelming onboard resources [4] [49].
- **Seamless Integration:** Pursue unified frameworks that integrate adaptive, robust, and data-driven methods for all flight phases, minimizing performance loss during transitions [4].
- **Hardware Validation:** Emphasize real-time hardware-in-the-loop testing and validation of advanced nonlinear MPC and DRL-integrated controllers [4] [38].
- **Cognitive and Autonomous Control:** Advance cognitive control systems that leverage AI for decision-making, fault detection, and adaptive mission planning [62] [63].
- **Multi-Objective Optimization:** Address challenges in balancing robustness, adaptability, computational efficiency, and energy consumption in complex, real-world environments [64].

Comparative Analysis and Synthesis

Comparative Effectiveness of Control Strategies

Paradigm	Strengths	Limitations	Application Domains
Nonlinear	Handles complex dynamics, effective in transitions, adaptable with hybridization	May require accurate models, computationally intensive	VTOL transitions, aggressive maneuvers
Adaptive	Robust to uncertainties, sensor noise, and disturbances; improved with hybridization	May be sensitive to adaptation law tuning	UAVs in uncertain environments, fault tolerance
Robust	Ensures stability under disturbances and faults, validated in hardware	May increase control effort, complexity	Fault-tolerant UAVs, adverse weather, actuator failures
MPC	Handles constraints, multi-variable systems, enables unified control	High computational demand, real-time implementation challenges	eVTOL, hybrid UAVs, urban air mobility

Recent studies confirm that hybrid and unified frameworks, especially those integrating data-driven methods, outperform classical approaches in adaptability, robustness, and transition handling [15] [17] [41] [59].

Conclusion

The state-of-the-art in UAV and VTOL control strategies from 2020 to 2022 is characterized by a shift toward hybrid and unified frameworks that integrate classical control with data-driven and learning-based methods. Nonlinear, adaptive, robust, and MPC paradigms are increasingly combined to address the challenges of multi-mode flight, environmental uncertainties, and real-time implementation. While significant progress has been made, especially in unified control and learning-enhanced MPC, research gaps remain in computational efficiency, hardware validation, and seamless integration across all flight phases. Future research should focus on hybrid architectures, real-time deployment, and cognitive control systems to unlock the full potential of UAV and VTOL platforms in complex, dynamic environments.

50. Deep reinforcement learning attitude control of fixed-wing UAVs Zhen, Y., Hao, M., Sun, W. Proceedings of 2020 3rd International Conference on Unmanned Systems, ICUS 2020, 2020 https://www.scopus.com/pages/publications/85098988337?origin=scopusAI

51. Integration of model reference adaptive control (MRAC) with PX4 firmware for quadcopters Niit, E.A., Smit, W.J. 2017 24th International Conference on Mechatronics and Machine Vision in Practice, M2VIP 2017, 2017 https://www.scopus.com/pages/publications/85048477983?origin=scopusAI

52. Robust Trajectory Tracking for a Control-Surface-Free Tilt-Rotor Convertible UAV Mimouni, M.Z., Araar, O., Oudda, A., Haddad, M. Unmanned Systems, 2025 https://www.scopus.com/pages/publications/85181523324?origin=scopusAI

53. Optimized Sliding Mode Control via Genetic Algorithm for Quad Tilt-Wing UAVs Fatemi, M.M. 2024 10th International Conference on Artificial Intelligence and Robotics, QICAR 2024, 2024 https://www.scopus.com/pages/publications/85191490368?origin=scopusAI

54. Unmanned Aerial Vehicle Control Using Hand Gestures and Neural Networks Nemec, J., Alba-Flores, R. 2022 IEEE International IOT, Electronics and Mechatronics Conference, IEMTRONICS 2022, 2022 https://www.scopus.com/pages/publications/85133864660?origin=scopusAI

55. Reinforcement Learning Control for 6 DOF Flight of Fixed-Wing Aircraft Zhang, S., Du, X., Xiao, J., (...), He, K. Proceedings of the 33rd Chinese Control and Decision Conference, CCDC 2021, 2021 https://www.scopus.com/pages/publications/85125188728?origin=scopusAI

56. Neural-Fly enables rapid learning for agile flight in strong winds O'Connell, M., Shi, G., Shi, X., (...), Chung, S.-J. Science Robotics, 2022 https://www.scopus.com/pages/publications/85129382866?origin=scopusAI

57. Fault Estimation and Fault Tolerant Control Strategies Applied to VTOL Aerial Vehicles with Soft and Aggressive Actuator Faults Ortiz-Torres, G., Castillo, P., Sorcia-Vázquez, F.D.J., (...), Martínez-García, M. IEEE Access, 2020 https://www.scopus.com/pages/publications/85078704057?origin=scopusAI

58. Dynamics and control of tailless vectored-thrust VTOL in hover-to-forward transition Di, W., Wei, Z., Liu, Q., (...), Tu, Z. Aerospace Science and Technology, 2025 https://www.scopus.com/pages/publications/105007136293?origin=scopusAI

59. An Improved Hybrid MRAC–LQR Control Scheme for Robust Quadrotor Altitude and Attitude Regulation Alblooshi, A.A., Hafez, I., Dhaouadi, R. Drones, 2025 https://www.scopus.com/pages/publications/105025810697?origin=scopusAI

60. Robust fault-tolerant control for underactuated takeoff and landing UAVs Zou, Y., Xia, K. IEEE Transactions on Aerospace and Electronic Systems, 2020 https://www.scopus.com/pages/publications/85103056434?origin=scopusAI

61. Model Predictive Control for Micro Aerial Vehicles: A Survey Nguyen, H., Kamel, M., Alexis, K., Siegwart, R. 2021 European Control Conference, ECC 2021, 2021 https://www.scopus.com/pages/publications/85124888896?origin=scopusAI

62. Deep reinforcement learning and its application in autonomous fitting optimization for attack areas of UCAVs Yue, L., Xiaohui, Q., Xiaodong, L., Qunli, X. Journal of Systems Engineering and Electronics, 2020 https://www.scopus.com/pages/publications/85091877439?origin=scopusAI

63. Implementation of Machine Learning Techniques in Unmanned Aerial Vehicle Control and Its Various Applications Fantin Irudaya Raj, E. Studies in Computational Intelligence, 2022 https://www.scopus.com/pages/publications/85127903545?origin=scopusAI

64. Drone deep reinforcement learning: A review Azar, A.T., Koubaa, A., Ali Mohamed, N., (...), Casalino, G. Electronics (Switzerland), 2021 https://www.scopus.com/pages/publications/85104555089?origin=scopusAI
